

Server Login Mod - Complete Documentation

Welcome to the Server Login Mod! This mod secures your Minecraft server by forcing players to authenticate before they can move, chat, attack, or interact with the world. It features SHA-256 password encryption, security questions for password recovery, and a robust admin approval system.

Security Features

- **Player Freezing:** Unauthenticated players are completely locked. They are given Slowness, Invisibility, Jump Fatigue, and Blindness. Their inventory is temporarily hidden, and they cannot take or deal damage.
- **Chat & Command Blocking:** Unauthenticated players cannot send chat messages or use any non-login commands.
- **Timeout:** Players have exactly 60 seconds to log in or register before the server kicks them.
- **Encrypted Data:** All passwords and security answers are hashed using SHA-256 before being saved to loginmod_auth.json. Admins cannot see player passwords.
- **Open/Closed Server States:** Admins can require manual approval for new accounts, or leave the server "Open" for immediate registration.

Player Commands

These commands are available to everyone who joins the server.

/register <password> <repeat> <question_number> <answer>

- **Description:** Creates a new account. You must pick a security question (1-5) and provide an answer. The answer can contain spaces!
- **Example:** /register MySecret123 MySecret123 1 Max The Dog
- **Security Questions:**
 1. What is the name of your first pet?
 2. What city were you born in?
 3. What is your mother's maiden name?
 4. What was the name of your first school?
 5. What is your favorite color?

/login <password>

- **Description:** Authenticates the player, restoring their inventory and removing all movement/vision restrictions.
- **Example:** /login MySecret123

/changepassword <new_password> <repeat>

- **Description:** Changes your password. You **must be logged in** to use this command.
- **Example:** /changepassword NewPass456 NewPass456

/resetpassword <new_password> <repeat> <security_answer>

- **Description:** Recovers an account if the password is forgotten. You **must be logged out** to use this command. The answer must match what you typed during /register.
- **Example:** /resetpassword NewPass456 NewPass456 Max The Dog

Admin Commands

These commands require Permission Level 2 (Server Operators / OP). If running from the server terminal console, do not include the / slash.

/requireapproval <value> [<require_reapproval>]

- **Description:** Toggles the server's security mode.
- **Argument 1 (value):** * true = Server is Closed. New registrations go to a pending list.
 - false = Server is Open. New registrations are instantly approved.
- **Argument 2 (require_reapproval - Optional):** * true = Forces players who registered while the server was *Open* to get admin approval the next time they join.
 - false = Allows players who registered while the server was *Open* to continue logging in normally.
- **Examples:**
 - /requireapproval false -> Front door is open. Everyone can register and play instantly.
 - /requireapproval true false -> Front door is closed. Old players are fine, new players need approval.
 - /requireapproval true true -> Complete Lockdown. New players need approval AND any "guest" players from earlier need approval.

/registerrequests

- **Description:** Displays a list of all usernames currently waiting in the pending queue.
- **Example:** /registerrequests

/registerrequest <approve|decline> <nickname>

- **Description:** Approves or declines a specific player's pending registration.
- **Example:** /registerrequest approve Notch

/registeredusers

- **Description:** Displays a list of every approved account on the server, and tells you whether they were manually approved by an admin or if they joined while the server was open.

- **Example:** /registeredusers

/unregister <nickname>

- **Description:** Instantly deletes a player's account data from the database. If the player is currently online, it will forcefully kick them from the server.
- **Example:** /unregister Notch
